High slew rate operational amplifier   NE/SE531

DESCRIPTION

The 531 is a fast slewing high performance operational amplifier which retains DC performance equal to the best general purpose types while providing far superior large-signal AC performance. A unique input stage design allows the amplifier to have a large-signal response nearly identical to its small-signal response. The amplifier is compensated for truly negligible overshoot with a single capacitor. In applications where fast settling and superior large-signal bandwidths are required, the amplifier out-performs conventional designs which have much better small-signal response. Also, because the small-signal response is not extended, no special precautions need be taken with circuit board layout to achieve stability. The high gain, simple compensation, and excellent stability of this amplifier allow its use in a wide variety of instrumentation applications.

FEATURES

• 35V/μs slew rate at unity gain

• Pin-for-pin replacement for μA709, μA748, or LM101

• Compensated with a single capacitor

PIN CONFIGURATIONS

N, FE Packages

OFFSET NULL	1	8	FREQ. COMP.
INVERTING INPUT	2	7	V+
NON–INVERTING INPUT	3	6	OUTPUT
V–	4	5	OFFSET

• Same low drift offset null circuitry as μA741

• Small-signal bandwidth 1MHz

• Large-signal bandwidth 500kHz

• True op amp DC characteristics make the 531 the ideal answer to all slew rate limited operational amplifier applications

ORDERING INFORMATION

DESCRIPTION	TEMPERATURE RANGE	ORDER CODE	DWG #
8-Pin Plastic Dual In-Line Package (DIP)	0 to +70°C	NE531N	0404B
8-Pin Ceramic Dual In-Line Package (CERDIP)	-55°C to +125°C	SE531FE	0580A
8-Pin Ceramic Dual In-Line Package (CERDIP)	0°C to +70°C	NE531FE	0580A

ABSOLUTE MAXIMUM RATINGS

| SYMBOL	PARAMETER	RATING	UNIT
V_S	Supply voltage	±22	V
$P_{D\ MAX}$	Maximum power dissipation T_A=25°C (still-air)[1]		
	FE package	780	mW
	N package	1160	mW
	Differential input voltage	±15	V
V_{CM}	Common-mode input voltage[2]	±15	V
	Voltage between offset null and V-	±0.5	V
T_A	Operating ambient temperature range		
	NE531	0 to +70	°C
	SE531	-55 to +125	°C
T_{STG}	Storage temperature range	-65 to +150	°C
T_{SOLD}	Lead soldering temperature (10sec max)	300	°C
	Output short-circuit duration[3]	indefinite	

NOTES:
1. The following derating factors should be applied above 25°C:
    FE package at 6.2mW/°C
    N package at 9.3mW/°C
2. For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.
3. Short-circuit may be to ground or either supply. Rating applies to +125°C case temperature or to +75°C ambient temperature.

NE/SE531

CYCLIC A-TO-D CONVERTER

One interesting, but much ignored, A/D converter is the cyclic converter. This consists of a chain of identical stages, each of which senses the polarity of the input. The stage then subtracts V_{REF} from the input and doubles the remainder if the polarity was correct. In Figure 1, the signal is full-wave rectified and the remainder of V_{IN}-V_{REF} is doubled. A chain of these stages gives the gray code equivalent of the input voltage in digitized form related to the magnitude of V_{REF}. Possessing high potential accuracy, the circuit using NE531 devices settles in 5μs.

TRIANGLE AND SQUARE WAVE GENERATOR

The circuit in Figure 2 will generate precision triangle and square waves. The output amplitude of the square wave is set by the output swing of op amp A-1, and R1/R2 sets the triangle amplitude. The frequency of oscillation in either case is:

$$f = \frac{1}{4RC} \cdot \frac{R2}{R1} \qquad (1)$$

The square wave will maintain 50% duty cycle even if the amplitude of the oscillation is not symmetrical.

The use of the NE531 in this circuit will allow good square waves to be generated to quite high frequencies. Since the amplifier A1 runs open-loop, there is no need for compensation. The triangle-generating amplifier must be compensated. The NE5535 device can be used as well, except for the lower frequency response.

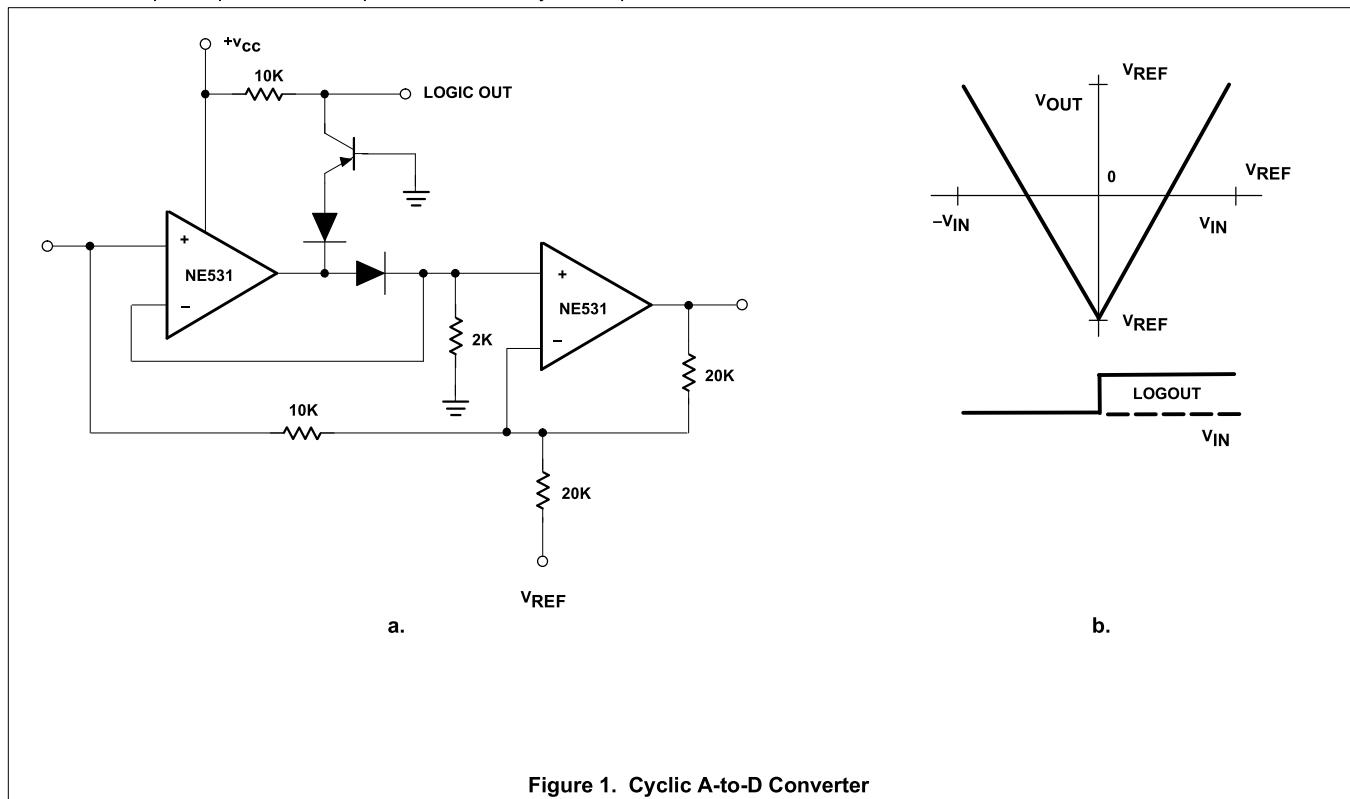

Figure 1. Cyclic A-to-D Converter
